# INTRODUCTION

## FOREWORD

This report summarizes data compiled from original birth, death, stillbirth, marriage, and dissolution (of marriage) records filed with the Office of Vital Statistics (VS) as required by law. Standard forms recommended by the U.S. Public Health Conference on Records and Statistics are used for certificates of birth, death, and fetal death (stillbirth).

Responsibility for filing birth certificates lies with physician, midwife, or other attendant. Funeral Directors, or persons acting as such, are legally charged with filing death and fetal death (of 20 or more weeks gestation) certificates. These are submitted to local registrars who in turn forward to VS. VS receives marriage and dissolution records directly from the various courts. Induced abortion reports are sent in directly by physicians, hospitals and clinics.

## HISTORICAL BACKGROUND

This marks the 65th year of statewide collection of birth and death records, begun in 1917. Florida was admitted to the Death Registration Area in 1919, and to the Birth Registration Area in 1924, by virtue of having met all U.S. Bureau of Census criteria. Marriage and dissolution records have been filed with VS since June 1927, abortion reports since April 1972.

## RESIDENT AND RECORDED EVENTS

Births and deaths are tabulated according to both usual place of residence (events occurring to Florida residents regardless of place of occurrence) and place of occurrence (events occurring in Florida regardless of usual residence). The former are herein referred to as resident, the latter recorded, events. Resident data have been tabulated since 1933, the year in which interstate exchange of vital records began. Prior to 1933, only recorded data are available.

Varying interpretations of "Usual residence" by Florida's many seasonal visitors and military families may influence the accuracy of resident tabulations to some extent, since the residence stated on the certificate is normally accepted without question. Institutional deaths, wherever possible, are allocated to the county from which the person was admitted. For births and stillbirths, the mother's residence is used when it differs from the father's.

Marriage, dissolution and abortion data are by place of occurrence only; there is no interstate exchange of these records. However, Florida dissolutions of marriage are granted to legal residents only; so there can only be resident dissolutions.

## CAUSE OF DEATH

The underlying cause of death is determined from death certificate medical information is accordance with procedures established by the World Health Organization and the National Center for Health Statistics (NCHS). Standardized codes are assigned from the International Classification of Diseases (ICD).

To keep abreast of changes in medical knowledge ICD is revised approximately every 10 years. Revisions and years used in Florida are:

| Revision | Years Used | Revision | Years Used |
|---|---|---|---|
| Second | 1917-1920 | Sixth | 1949-1957 |
| Third | 1921-1929 | Seventh | 1958-1967 |
| Fourth | 1920-1940 | Eighth | 1968-1978 |
| Fifth | 1941-1948 | Ninth | 1979- |

Due to these revisions, some of which involve major changes, year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used, or the changes from one revision to another were minor.

The Ninth Revision contains major modifications of some sections, so that more deaths are now assigned under Eighth Revision rules, and vice versa. NCHS coded a sample of 1976 U.S. deaths by both Eighth and Ninth Revision rules. The results were grouped by major causes, and for each of these, the number of Ninth Revision deaths was divided by the number of Eighth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Suicide is 1.0032; this implies that Ninth Revision coding of a given set of death certificates will produce about 32/100ths of one percent more Suicides than would Eighth Revision rules.

National comparability ratios are shown in Table M for Florida's leading causes of death. When comparing deaths from these causes for 1979 or later to those for 1968-78, the ratio multiplied by the earlier data (either number of deaths or death rate) will yield an approximation of the data which would have resulted under Ninth Revision rules.

## AVAILABILITY OF DATA

In addition to data presented here, much greater detail is available from unpublished tables upon request. Also special statistical tapes and tables may be requested on a fee-for-service basis. Information concerning data available from these sources may be obtained from Public Health Statistics Section, P.O. Box 210, Jacksonville, Fla. 32231 Phone (904) 354-3961, or SUNCOM 673-3180.

## RACE

Race is usually counted as it is stated on birth, death and marriage certificates, with such designations as "Hispanic" counted as white. For births, the child is counted as white if both parents are white, or if one is white and the other unknown or not stated; the child is counted as nonwhite in all other cases where the race of at least one parent is known; the race is left as unknown or not stated only when both parents are unknown. Specific nonwhite races are assigned according to a somewhat complex coding procedure, copies of which are available on request. The 1970 U.S. Census for Florida showed a population that was 15.3 percent black and less than 0.4 percent other nonwhite races. The 1980 U.S. Census shows 13.8 percent black and 2.2 percent other nonwhite. This increase in the size of the other nonwhite population results mainly from changes in the Census Bureau's definitions.

## UNKNOWNS

Tabular totals in this publication may include some records of unknown age, race or sex. In these cases the components shown will not add to the total.

## COMPLETENESS OF DATA

Tabulation of data for this annual report was begun after allowing a reasonable time for receipt of late records. A few certificates were received after tabulation and are not included in this report. These records represent only a small fraction of the total, and their omission does not materially alter the facts presented.

## ACKNOWLEDGEMENT

Basic tabulations for this report were prepared by the Office of Management Systems, and we gratefully acknowledge the able assistance of Mr. M.E. Gardner, Jr., Information Systems Supervisor.

## POPULATION

At midyear 1980 Florida's population had increased by an average of 3.6 percent annually since 1970. This is about 13 percent higher than the growth rate during the previous (1960-70) decade but 39 percent lower than the 1950-60 rate. The 1980-81 growth rate is a fraction higher at 3.7 percent (Table A).

The annual average numerical increase for 1970-80 of 294,805 includes a natural increase (excess of resident births over resident deaths) of 23,739 leaving an estimated net in-migration of 271,066 ... or 22,589 per month. This compares with a monthly in-migration of 13,564 in the 1950-60 decade and 11,317 in the 1960-70 decade.

The 1980-81 natural increase was up slightly to 25,840 (9%) and migration rose to 333,829 (23%). The white population increased by 3.6 percent and the nonwhite population by 3.9 percent in 1981, the same change rates exhibited during the decade of the 1970s.

The Florida nonwhite population was 16.1 percent of the total in 1981, compared to 16.8 in the U.S. (1980 census) as a whole. The 65-and-over population was at 17.7 percent, far above the U.S. (census) figure of 11.3 percent. The under-15 group was down to 18.4 percent in Florida vs. a U.S. (census) proportion of 22.6 percent.

1981 Midyear population estimates are based on April 1 intercensal estimates by the Bureau of Economic & Business Research, University of Florida.

Based on data from Bureau of Economic & Business Research, University of Florida

GENERAL NATALITY

Florida's resident live births jumped by 6,710 in 1981; 4,530 for whites and 2,166 for nonwhites. These figures were lower than the 1980 record increase of 10,666 total births, but they still constitute a substantial increase of 5.1 percent overall.

The overall rate increased from 13.4 to 13.6 per thousand population, or 1.5 percent. The rate for whites increased by 0.9 percent; for nonwhites 1.8 percent. The new rates were, in all three cases, the highest since 1972, and they continued a trend which began in 1977 for nonwhites, 1979 for whites.

The rate for nonwhites remains about double the rate for whites.

Table B

RESIDENT LIVE BIRTHS AND RATES PER 1000 POPULATION BY RACE, FLORIDA, 1950, 1960 AND 1970-1981

| YEAR | BIRTHS TOTAL | BIRTHS WHITE | BIRTHS NON-WHITE | RATES TOTAL | RATES WHITE | RATES NON-WHITE |
|---|---|---|---|---|---|---|
| 1950 | 64,370 | 45,699 | 18,671 | 22.8 | 20.7 | 30.5 |
| 1960 | 115,610 | 84,402 | 31,208 | 23.1 | 20.5 | 34.9 |

| 1978 | 113,367 | 82,304 | 31,033 | 12.3 | 10.6 | 21.1 |
| 1979 | 121,145 | 88,712 | 32,403 | 12.7 | 11.1 | 21.3 |
| 1980 | 131,811 | 96,508 | 35,284 | 13.4 | 11.7 | 22.4 |
| 1981 | 138,521 | 101,038 | 37,450 | 13.6 | 11.8 | 22.8 |

FERTILITY

The general fertility rate for 1979-81 was up 2.8 percent: 62.6 vs. a 1974-76 average of 60.9, per 1000 women age 15-44. The increase for whites was 2.2 percent, for nonwhites 3.9 percent. The rate for nonwhites is now 66.7 percent higher than the rate for whites.

Fertility was down for both the teenage groups and for those 40 and over. The fertility increases were in the thirties for white women, twenties and thirties for nonwhite women.

Among white women 30-34 the fertility increase was 23 percent, and for those 35-39 about 16 percent. For white women in their twenties fertility actually continued to fall.

For nonwhite women fertility rates reversed their long-term down-trends in four five-year age groups, and the percentage increases were: ages 20-24, 6 percent; ages 25-29, 21 percent; ages 30-34, 27 percent; and 35-39, 12 percent.

Median age of mothers rose 2.9 percent overall and for white women, to 24.6 years overall and to 25.2 years for whites. Median age of nonwhite mothers, always lower than for whites, rose to 23.1 years, a 5.0 percent increase.

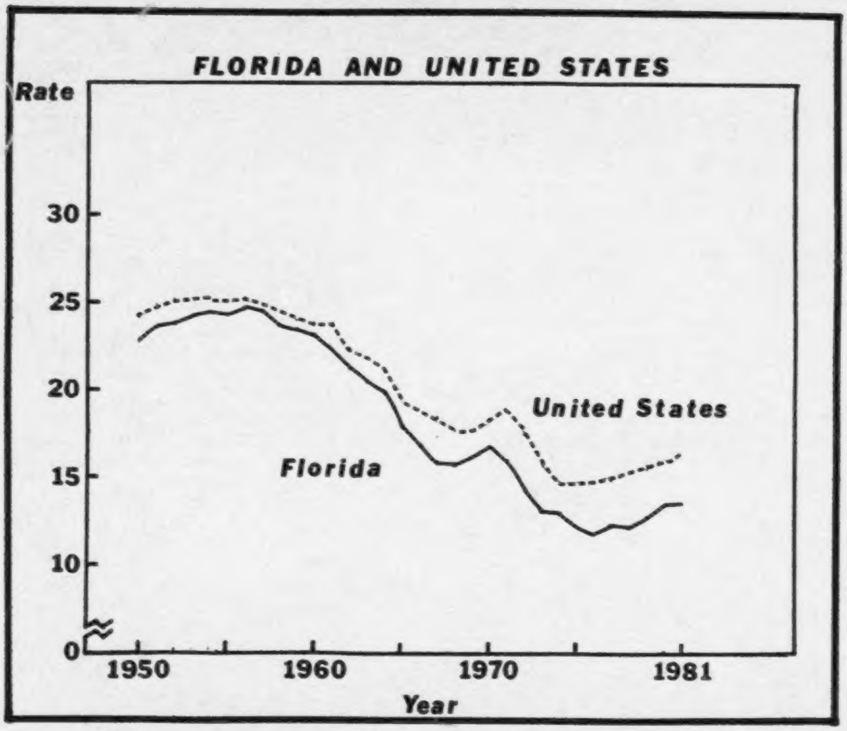
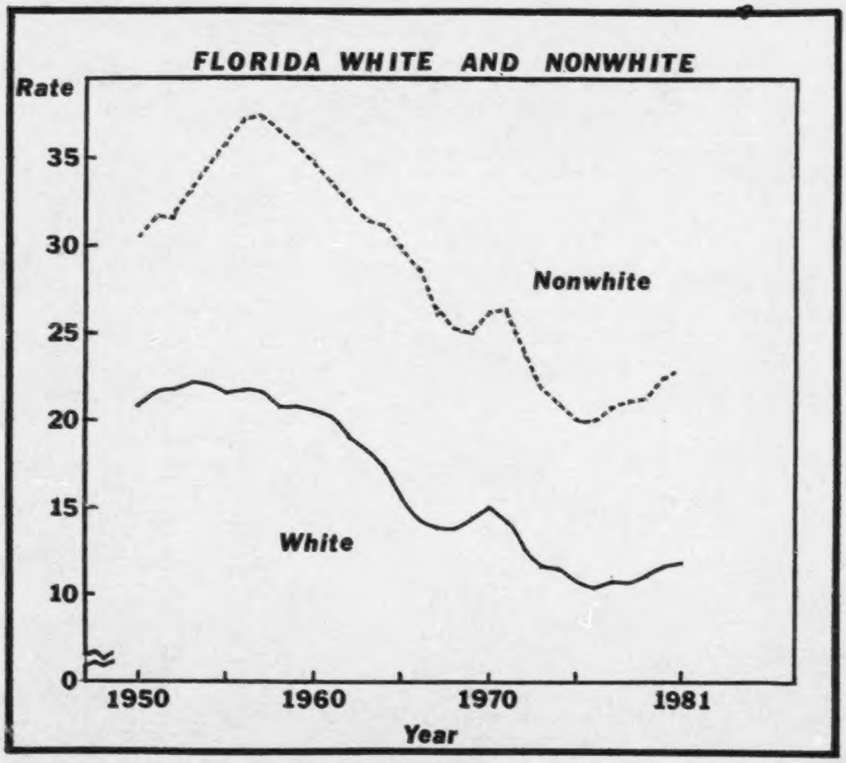
Figure 2

## RESIDENT BIRTH RATES PER 1000 POPULATION 1950-1981





BIRTH ATTENDANTS

By 1960 most white births were in hospital, and nonwhite births were approaching the same high proportions. Maternal and perinatal mortality had been reduced by general advances in medical knowledge, increasing proportions of deliveries by physicians, training and licensing of midwives.

The proportion of physician hospital deliveries showed small declines between 1980 and 1981, to 93.9 percent overall, 95.3 percent for whites, and 90.3 for nonwhites. Since birthing centers are licensed maternity hospitals, they are not distinguishable from other hospitals in current statistics.

There were increases in midwife deliveries, from 3.3 to 3.4 percent for whites, 6.6 to 7.6 percent for nonwhites. Total physician deliveries dropped to 95.6 percent for whites and 91.0 percent for nonwhites.

| 1981 | 95.3 | 0.3 | 3.4 | 1.0 | 90.3 | 0.7 | 7.6 | 1.4 |

LOW-WEIGHT BIRTHS

Birthweights under 2500 grams (5 1/2 lbs.) are arbitrarily called low-weight. There are inherent normal differences in birthweight distribution between sexes. Females generally weigh less but have lower infant mortality. On the other hand, studies have shown that the risk of neonatal mortality is much higher for low-weight births than it is for "normal" weights. Table E shows that proportions of low-weight births in Florida have declined over the past decade.

Table E

PERCENT OF LOW-WEIGHT* RESIDENT LIVE BIRTHS, BY RACE & SEX, FLORIDA, 1969-1981

| | | WHITE | | NONWHITE | |

*under 2500 grams (5 1/2 lbs.)

BIRTHS TO UNWED MOTHERS

Since 1970 the percentage of white mothers who were unmarried has grown from 6.5 to 11.2, but these percentages are still quite small in comparison with those for nonwhites: from 41.1 to 57.7 in the same period. Since 1973 more than half of all nonwhite mothers have been unmarried (Tables F & G, Figure 3).

## INDUCED ABORTIONS

Induced abortions have been legal in Florida since April, 1972. The 1981 pregnancy rate among females of childbearing age was 9.6 percent, and the induced abortion ratio was 32.6 per 100 pregnancies.

Table H

REPORTED TERMINATIONS OF PREGNANCY IN FLORIDA

| YEAR | REPORTED INDUCED ABORTIONS (Since APR 1972) | TOTAL RESIDENT BIRTHS -- LIVE PLUS STILL* | TOTAL KNOWN PREGNANCIES | PREGNANCY RATE PER 100 WOMEN AGE 15-44 | ABORTION RATIO PER 100 PREGNANCIES |

*stillbirths of 20 or more weeks gestation

## FETAL DEATHS (STILLBIRTHS) 20 WEEKS

In Florida, a fetal death certificate is required when the gestation period is 20 or more weeks. These deaths usually result from "spontaneous", i.e., not induced, abortions. Thus the probability that a given event would be included in both statistical entities, Induced Abortions and Fetal Deaths, is extremely low.

The fetal death ratio per 1000 live births continued at a relatively low level in 1981 despite rate increases of 8.0 percent for whites and 1.4 percent for nonwhites (Table I, Figure 4).

Table I

RESIDENT FETAL DEATHS* WITH RATIOS PER 1000 LIVE BIRTHS, BY RACE, FLORIDA, 1950, 1960 & 1970-1981

| YEAR | DEATHS TOTAL | DEATHS WHITE | DEATHS NON-WHITE | RATIOS TOTAL | RATIOS WHITE | RATIOS NON-WHITE |

## INFANT MORTALITY

The 1981 Infant Mortality rates dropped to 10.4 (a new low) for whites and 21.1 for nonwhites (Table K, Figure 4).

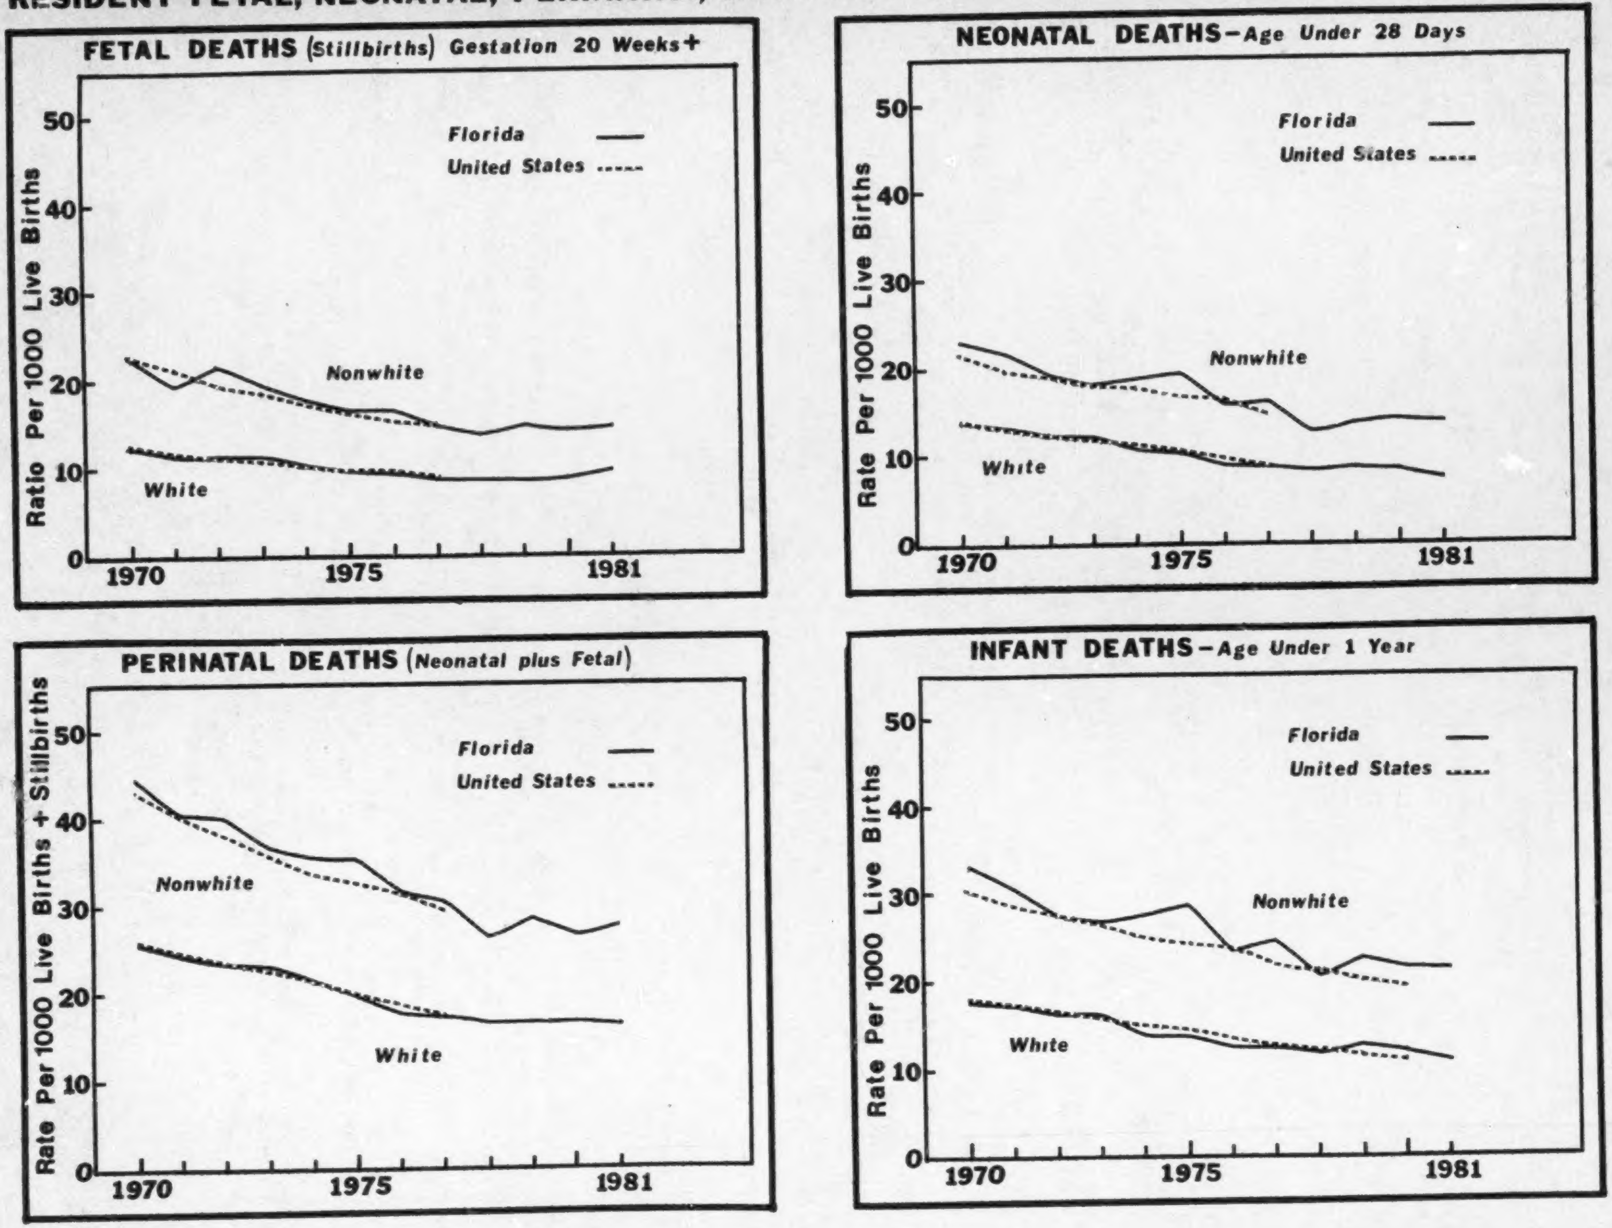
# RESIDENT FETAL, NEONATAL, PERINATAL, & INFANT MORTALITY BY RACE; FLA. & U.S., 1970-81



## GENERAL MORTALITY

Florida's resident deaths for 1981 rose to 109,106 and the rate rose to 10.7 per 1000 population. Although the general trend in the state's mortality has been upward since 1950 due to immigration of retirees, the rate dropped in 1974 and 1975. It is now climbing again (Table L, Figure 5). In 1981 the rate for whites rose to 11.3, while the rate for nonwhites dropped to 7.4 per 1000.

The age-adjusted death rates fell slightly to 5.6 overall, 5.4 for whites and 6.4 for nonwhites. These rates imply that, if age distributions were the same as a standard population for both race groups and remained constant from year to year, (1) nonwhites would have higher death rates than whites, 6.4 vs. 5.4 per 1000 in 1981, (2) mortality would have shown a decline for both groups since 1950, and (3) Florida would have a slightly lower death rate than the U.S. as a whole. The U.S. age-adjusted rate for 1980 was 5.9 vs. 5.7 for Florida (Table L, Figure 5).

## CAUSES OF DEATH

Table M shows Florida's leading causes of death in 1971 and 1981. Heart, Cancer, Stroke and Accidents continued as the top four, accounting for 71.9 percent of all 1971 deaths and 73.3 percent in 1981.

COLD (Chronic Obstructive Lung Disease & Allied Conditions) rose to fifth, swapping places with Pneumonia-Influenza, now sixth. Cirrhosis rose to seventh, while Suicide rose to eighth position. Homicide rose to tenth, and Diabetes remained in ninth position.

Perinatal Conditions, which were ranked seventh in 1971, had dropped to twelfth in 1981. Atherosclerosis was tenth in 1971 and had dropped to eleventh.

Among whites cause-of-death rankings were the same as the overall rankings for the first seven causes, but Suicide, Diabetes and Atherosclerosis were eighth, ninth and tenth respectively.

Among nonwhites the first four causes were the same, but the fifth cause of death was Homicide, the sixth was Perinatal Conditions, the seventh Diabetes, eighth Pneumonia-Influenza, ninth COLD and tenth Cirrhosis. Atherosclerosis ranked fourteenth for nonwhites, while Suicide was seventeenth.

## HEART DISEASE

The unadjusted Heart Disease death rate rose again in 1981, continuing a slow upward trend since 1970.

Heart Disease is still Florida's, and the nation's, leading cause of death, as it has been for more than 50 years. However, the age-adjusted rates for this cause indicate great improvement over the past two decades.

Differences between unadjusted rates for males and females are not due to age distribution; but between rates for whites and nonwhites, age distribution appears to be the primary factor, since there is a much higher proportion of older people among whites. Confirming this, the age-adjusted rates for nonwhites (not shown) are much higher than those for whites.

Ischemic (Atherosclerotic) Heart Disease was the cause of about 78 percent of these deaths among whites and about 59 percent among nonwhites. Hypertension-related Heart Disease caused 2.6 percent of Heart deaths among whites, 9.3 percent among nonwhites.

CANCER (MALIGNANT NEOPLASMS)

Until 1981 Malignant Neoplasms in Florida had risen in death rate for seven consecutive years, mainly due to population aging. The 1981 decrease in the age-adjusted rate returns this measure to about its 1970 level, suggesting that all of the recent increases were due to aging.

Males have higher Cancer death rates than females, and rates for whites are higher than for nonwhites, although the racial difference, again, is primarily attributable to the aging of the white population.

Five principal types of Cancer are those of the Digestive System, Respiratory System, Genital Organs, Breast and the Leukemias. Respiratory Cancer has far out-stripped the others in rate of increase for the last 31 years, having more than quadrupled in rate, from 15.5 to 68.8 deaths per 100,000 population, and now exceeds the Digestive Cancer death rate, which rose only 41 percent (Table Q).

The Leukemia death rate nearly doubled in this period as did the rate for Breast Cancer, while Genital Cancer rose by only 55 percent.

The smaller increases in Genital, Breast, Digestive Cancer and Leukemia are probably a reflection of earlier detection and treatment methods, combined with intensive public education efforts, the Pap smear for females Genital Cancers, self-examination for Breast Cancers, and chemotherapy for Leukemias.

Table P

RESIDENT MALIGNANT NEOPLASM (CANCER) DEATHS AND DEATH RATES PER 100,000 POPULATION, BY RACE AND SEX, FLORIDA, 1950, 1960 AND 1970-1981

## STROKE (CEREBROVASCULAR DISEASE)

Stroke continued as the third leading cause of death, but both the crude and age-adjusted rates have declined quite consistently during the past decade.

Females have higher Stroke death rates than males, and whites have higher rates than nonwhites. Again, both of these differences are due to aging, since age-adjustment in both cases gives an opposite effect, i.e., males have higher age-adjusted Stroke death rates than females, and nonwhites have much higher age-adjusted rates than whites.

Table R

AA: age-adjusted to U.S. 1940 standard population

## ACCIDENTS (BY PLACE OF ACCIDENT)

Accident mortality increased in 1981 both in number and rate.

Males have much higher accidental death rates than females, and nonwhite males have higher rates than white males. Among females, however, the reverse is true, at least in recent years: white females have higher rates than nonwhite females.

Table S

DEATHS DUE TO ACCIDENTS WHICH OCCURRED IN FLORIDA, AND DEATH RATES PER 100,000 POPULATION BY RACE AND SEX, 1950, 1960, AND 1970-1981

Deaths occurring to skin and scuba divers are not directly classifiable by ICDA codes. For this reason, and because of growing concern, a special record has been kept since 1960 of Florida deaths in connection with this increasingly popular but dangerous sport.

Table U shows 22-year results of the study. Of 526 deaths, 240 occurred in salt water (ocean, gulf, bay, river mouth) and 286 were in inland waters (sink hole, spring, lake, upriver, canal, rockpit, pool). Of the latter, 229 occurred in underwater cave explorations. Monroe, Broward, Palm Beach, Dade, Pinellas and Bay Counties had a total of 216 deaths ... most of the salt water group. Suwannee, Gilchrist, Volusia, Holmes, Walton, Hernando, Levy and Marion had a combined 210 ... most of the fresh water deaths. The latter group of 8 counties also accounted for 185 of the 229 cave diving deaths.

496 of the victims were male, 483 white and 13 nonwhite; the other 30 were white females. Median age was 24.4 years.

For the last 13 years of the study, 1969-1981 residence data show that 171 of 402 victims, or 42.5 percent, were from out of state. Among cave divers 98 of 170 or 57.6 percent, were nonresidents.

CHRONIC OBSTRUCTIVE LUNG DISEASE & ALLIED CONDITIONS

The cause group which included Bronchitis, Emphysema and Asthma has been expanded to include some minor diseases plus the increasingly-used general term: Chronic Airways Obstruction. These causes combined, and referred to as Chronic Obstructive Lung Disease and Allied Conditions, now constitute the fifth ranking cause of death.

This cause group is probably more directly related to cigarette smoking and/or air pollution than any other ... with the exception of lung cancer.

The death rate in 1981 for white males was almost equal to the combined rates of the other three race-sex segments for this cause. The rate for white females has increased much more rapidly than either of the male groups over the past decade, but the trend for nonwhite females is not yet clear.

The age-adjusted rate is also on the rise for this cause group.

## PNEUMONIA & INFLUENZA

Deaths from Pneumonia and Influenza ("Flu") are reported together because of the close relationship between the two causes. Although Flu deaths normally constitute a very small fraction of the total, there is usually a great increase in Pneumonia deaths during Flu epidemic years. There is little doubt that most of these excess Pneumonia deaths were originally Flu cases.

Florida's 1981 Pneumonia-flu death rate was up slightly, but the long-term trend was still downward. The age-adjusted rate is less than half of the crude rate, reflecting again the fact that this cause of death affects mostly older people, and Florida has a high proportion of elderly.

Table W

## CHRONIC LIVER DISEASE & CIRRHOSIS

In 1981 32.4 percent of the Chronic Liver Disease deaths were specified as associated with alcoholism; the rest had no mention of alcohol, but there is little doubt that many of these were also alcohol-related.

There was a decrease in overall Cirrhosis mortality for 1981, and the age-adjusted rate dropped by 7.2 percent.

Males have higher Cirrhosis death rates than females; this is true for all races and remains the case after age-adjustment. Racial differences, however, are strongly affected by age distribution. Table X shows rates for whites that are consistently higher than those for nonwhites. But after age-adjustment the rate for nonwhite males is much higher than the rate for white males, and nonwhites females have a much higher rate than white females.

Table X

RESIDENT CHRONIC LIVER DISEASE & CIRRHOSIS & RATES PER 100,000 POPULATION, BY RACE AND SEX, FLORIDA, 1950, 1960 AND 1970-1981

AA: age-adjusted to U.S. 1940 standard population

## SUICIDE

Suicide, Florida's eighth-ranked cause of death in 1981, showed a long-term increase in rate from 11.2 in 1950 to 17.3 in 1977 but has dropped somewhat since then. The latest rate was 16.1 per 100,000 population. Age-adjusting drops the rate slightly, reflecting high suicide rates among the elderly, but the Florida rate remains persistently high after adjustment.

A higher proportion of widowed/separted/divorced persons who are known to have high suicide rates, and of other displaced persons who have left their homes to come to Florida, probably accounts for much of the difference between the Florida and U.S. suicide rates (16.1 vs. 11.5 in 1981).

Whites have much higher suicide rates than nonwhites, and males are higher than females in both race groups. Age-adjustment has little effect on these relationships.

Table Y

## DIABETES MELLITUS

Diabetes is another disease in which the death rate rises sharply with age, and this was the main reason for Florida's general increase in Diabetes death rate, which persisted until 1973. Since that time there has been a downtrend, probably due to improved treatment methods.

After age-adjustment, nonwhites have much higher Diabetes mortality than whites. Nonwhite females have the highest mortality and white females the lowest; nonwhite males have the second highest and white males of course the second lowest.

## HOMICIDE

Homicide was the tenth cause of death in 1981, displacing Atherosclerosis. The 1,598 homicide deaths were the most ever registered in Florida. The increased homicide rate, however, at 15.7 per 100,000 population, was nowhere near the level shown prior to 1947.

Age-adjustment of the homicide rate in Florida results in a slightly higher rate, reflecting the fact that homicide victims are generally younger people who comprise a relatively small proportion of Florida's population.

The largest rate increases in 1981 were among white males, 10.8 percent, and nonwhite females, 1.4 percent. The rate for white females remained at 4.6 per 100,000 population, and the rate actually decreased by 9.2 percent for nonwhite males.

## TUBERCULOSIS

Once Florida's leading cause of death (1917), Tuberculosis now ranks about twenty-eighth among major cause groups. The general trend since 1950 has been downward, although there remains a dangerous reservoir of infection which needs to be monitored.

Tuberculosis death rates are highest for nonwhite males, then nonwhite females and white males, with white females having less than one death per 100,000 population.

# LEADING CAUSES BY AGE (TABLE CC)

## INFANTS (Under 1 Year)

The infant death rate per 100,000 infant population* dropped about 34 percent between 1971 and 1981. Four of the five leading causes dropped in number and rate. Perinatal Conditions and Congenital Anomalies (Birth Defects) continued as the two leading causes, accounting for 72 percent of infant deaths in 1971 and 69 percent in 1981. Sudden Infant Deaths Syndrome, classified as a separate cause of death since 1974, and estimated here for 1971, rose in number and rate is now the third cause of infant death; it is the leading cause after the second week of life. Pneumonia-Influenza, now fourth, dropped in number and rate over the decade, as did Accidents which remain fifth.

## 1 - 4 AGE GROUP

There was a 21 percent drop in overall death rate for the 1-4 age group during the decade. Accidents remained as the leading cause of death for this age group ... Drownings and Motor Vehicle Accidents were the principal types. For 1981 Congenital Anomalies ranked second, Cancer was third, Homicide fourth, and Pneumonia-Influenza fifth. Only Congenital Anomalies and Homicide showed increases, both in number and rate. Because of the small numbers of deaths in this age group the rankings may vary considerably from year to year. However, although Pneumonia-Influenza was the second cause of death in 1971, the other members of the top five were otherwise unchanged in ranking in 1981.

## 5 - 14 AGE GROUP

The overall death rate for the 5-14 age group fell by 30 percent during the decade. Accidents and Cancer remained as the two leading causes. Homicide, Congenital Anomalies, and Suicide were the next three causes. Pneumonia-Influenza, 1971's fourth cause, was no longer among the leading five. All of the leading causes showed decreases in number and rate except Homicide and Suicide. The leap from twelfth to fifth for Suicide may be unimportant since the actual numbers of deaths are quite small.

## 15 - 24 AGE GROUP

The 15-24 age group had an overall seven percent drop in death rate for the decade. Accidents, the leading cause, had a decrease of 13 percent in rate, while Homicide and Suicide, numbers two and three, had substantial increases: 38 and 58 percent respectively. The Cancer rate dropped by 30 percent, while the Heart Disease rate rose by 4 percent. Injuries of Undetermined Intent, fifth in 1971, dropped out of the leading cause list for this age group.

## 25 - 44 AGE GROUP

The overall drop in rate was 19 percent for the 25-44 age group during the decade 1971-1981. The five leading causes in 1971 were also the five leading causes in 1981, but their positions relative to each other were somewhat reshuffled. Accidents remained the leading cause while Homicide rose from fourth to second, Cancer dropping from second to third and Heart Disease from third to fourth. Suicide remained fifth. Again, only Homicide and Suicide showed rate increases.

## 45 - 64 AGE GROUP

The overall death rate dropped by 18 percent for the 45-64 age group during the decade. Cancer replaced Heart Disease as the leading cause of death and showed a rate increase of about five percent. Stroke remained in third position, while Accidents and Cirrhosis remained fourth and fifth. Four of the five leading causes decreased in rate, Cancer being the exception.

## 65-AND-OVER AGE GROUP

The overall death rate decrease for the 65-and-over age group was five percent during the decade. Heart Disease, Cancer and Stroke retained their one-two-three rankings with only Cancer showing a rate increase, 12 percent. Chronic Obstructive Lung Disease rose from fifth to fourth with a rate increase of 46 percent, partially due to changes in the types of diseases now included in this grouping. Pneumonia-Influenza dropped to fifth.

*not to be confused with the infant mortality rate shown on page 8.

MATERNAL MORTALITY

Florida's 1981 maternal mortality rate of 1.1 maternal deaths per 10,000 live births was a new record low. The rate for white mothers decreased slightly to 0.8 while the rate for nonwhite mothers at 1.9 was also a new record low.

Table DD

RESIDENT MATERNAL DEATHS AND MATERNAL MORTALITY RATES PER 10,000 LIVE BIRTHS, BY RACE, FLORIDA, 1950, 1960 AND 1970-1981

| YEAR | DEATHS TOTAL | DEATHS WHITE | DEATHS NON-WHITE | RATES TOTAL | RATES WHITE | RATES NON-WHITE |
|---|---|---|---|---|---|---|
| 1950 | 83 | 34 | 49 | 12.9 | 7.4 | 26.2 |
| 1960 | 58 | 17 | 41 | 5.0 | 2.0 | 13.1 |
| 1970 | 35 | 21 | 14 | 3.0 | 2.4 | 5.0 |
| 1971 | 34 | 17 | 17 | 2.9 | 2.0 | 5.7 |
| 1972 | 24 | 9 | 15 | 2.2 | 1.1 | 5.3 |
| 1973 | 23 | 10 | 13 | 2.1 | 1.3 | 4.6 |
| 1974 | 15 | 6 | 9 | 1.4 | 0.7 | 3.2 |

| 1978 | 14 | 7 | 7 | 1.2 | 0.9 | 2.3 |
| 1979 | 17 | 5 | 12 | 1.4 | 0.6 | 3.7 |
| 1980 | 16 | 9 | 7 | 1.2 | 0.9 | 2.0 |
| 1981 | 15 | 8 | 7 | 1.1 | 0.8 | 1.9 |

MARRIAGES AND DISSOLUTIONS

The number of marriages in Florida reached an all-time high in 1981 as did the marriage rate at 11.1 per 1000 population.

Dissolutions of marriage (including annulments) also reached an all-time in 1981, both numerically and rate-wise. The rate reached 7.4 dissolutions per 1000 population.

Many of Florida's dissolutions are granted to persons who establish residency in the state specifically for this purpose; these cases account for most of the difference between the Florida and U.S. dissolution rates, as well as for the high ratio of dissolutions per 100 marriages in Florida, now at 66.8, compared to exactly 50.0 nationally. This ratio in Florida remains below its 1975 peak of 74.3 per thousand. As other states become more liberal in their divorce laws, the difference between Florida and the nation should continue to lessen (Table EE, Figure 6).

Table EE

MARRIAGES AND DISSOLUTIONS* OF MARRIAGE, RATES PER 1,000 POPULATION, AND DISSOLUTIONS PER 100 MARRIAGES, FLORIDA, 1950, 1960 AND 1970-1981

| YEAR | MARRIAGES | RATE | DISSOLUTIONS OF MARRIAGE | RATE | DISSOLUTIONS PER 100 MARRIAGES |
|---|---|---|---|---|---|
| 1950 | 27,588 | 9.8 | 18,033 | 6.4 | 65.4 |
| 1960 | 39,315 | 7.9 | 19,511 | 3.9 | 49.6 |
| 1970 | 69,249 | 10.1 | 37,506 | 5.4 | 53.7 |
| 1971 | 75,108 | 10.3 | 43,728 | 6.0 | 57.9 |
| 1972 | 82,176 | 10.7 | 51,677 | 6.7 | 62.7 |
| 1973 | 89,587 | 11.0 | 56,006 | 6.9 | 62.3 |
| 1974 | 90,337 | 10.6 | 59,609 | 7.0 | 65.8 |
| 1975 | 85,427 | 9.9 | 63,446 | 7.3 | 74.3 |
| 1976 | 86,143 | 9.8 | 63,223 | 7.2 | 73.4 |

| 1978 | 95,327 | 10.3 | 66,018 | 7.2 | 69.3 |
| 1979 | 103,245 | 10.8 | 69,707 | 7.3 | 67.5 |
| 1980 | 108,344 | 11.0 | 71,578 | 7.3 | 66.1 |
| 1981 | 113,003 | 11.1 | 75,490 | 7.4 | 66.8 |

*includes annulments

LIFE EXPECTANCY

In 1980, life expectancy at birth had increased about 2.4 years for white males and 1.9 for white females in the ten years since 1970, while it had increased by about 8.9 years for nonwhite males and 9.9 for nonwhite females. White females continued to have a greater expectancy, 78.7 years, than any other population segement, followed by nonwhite females at 77.8 years, white males at 70.8 years, and nonwhite males at 68.2 years (Table FF).

Table FF

YEARS OF LIFE EXPECTANCY AT BIRTH FOR FLORIDA RESIDENTS, 1960, 1970 AND 1980

| | 1960 | 1970 | 1980 |

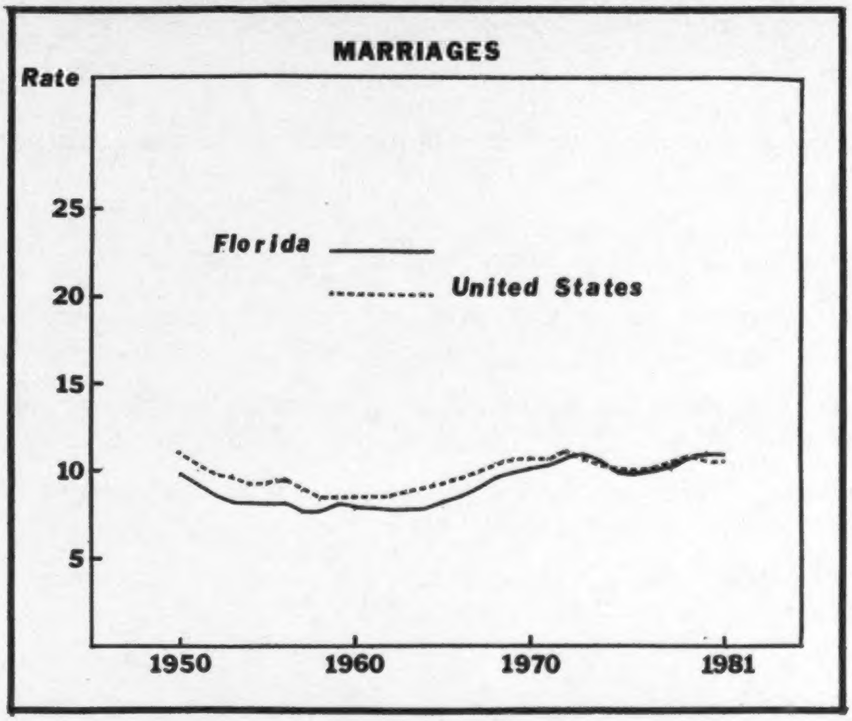
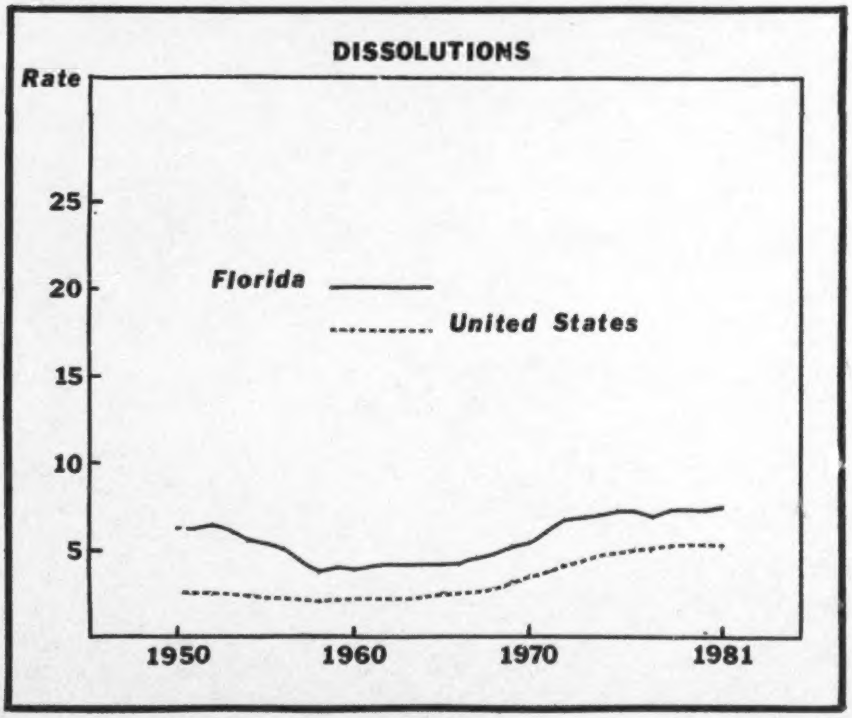
*Figure 1*

## *MARRIAGE, DISSOLUTION RATES PER 1000 POPULATION FLORIDA AND UNITED STATES, 1950-1981*





The following procedures and symbols are used in Tables 1 through 27.

(1) All rates and ratios are rounded to the nearest tenth.

(2) All rates and ratios that calculate to less than 0.05 are printed as "0.0".

(3) Undefined rates and ratios, i.e., those with denominator of zero, are printed as "- - -".

(4) Anomalous rates and ratios, i.e., those that calculate to greater than 999.9, are also printed as "- - -".

(5) Unreliable rates and ratios, i.e., those with denominator less than 100, are followed by an asterisk "*".
